

## Quiz (Rate Law 2)

1. Nitrogen monoxide reacts with hydrogen at 1150 °C . The equation of the reaction is as follows:  $2\text{NO}(\text{g}) + 2\text{H}_2(\text{g}) \longrightarrow \text{N}_2(\text{g}) + 2\text{H}_2\text{O}(\text{g})$

The results of the series of experiments are shown below:

| Experiment | Initial [NO(g)]<br>(mol dm <sup>-3</sup> ) | Initial [H <sub>2</sub> (g)]<br>(mol dm <sup>-3</sup> ) | Initial rate<br>(mol dm <sup>-3</sup> s <sup>-1</sup> ) |
|------------|--|---|---|
| 1          | 0.010                                      | 0.010   | 0.006   |
| 2          | 0.020                                      | 0.030   | 0.144   |
| 3          | 0.010                                      | 0.020   | 0.012   |

Write the rate equation for the reaction.

2. Consider the following reaction:  $\text{CO}(\text{g}) + \text{NO}_2(\text{g}) \longrightarrow \text{CO}_2(\text{g}) + \text{NO}(\text{g})$

A series of experiments was carried out to study the relationship between the initial concentration and the initial rate at 298 K. The results are shown below:

| Experiment | Initial concentration<br>of CO(g) (mol dm <sup>-3</sup> ) | Initial concentration<br>of NO <sub>2</sub> (g) (mol dm <sup>-3</sup> ) | Initial rate (mol<br>dm <sup>-3</sup> s <sup>-1</sup> ) |
|------------|---|---|---|
| 1          | 0.1   | 0.2   | 0.025   |
| 2          | 0.2   | 0.2   | 0.050   |
| 3          | 0.1   | 0.4   | 0.050   |
| 4          | 0.4   | 0.2   | 0.100   |

Write the rate equation for the reaction.

3. The decomposition of nitrogen dioxide is a second order reaction. The equation of the reaction is as follows:  $2\text{NO}_2(\text{g}) \longrightarrow 2\text{NO}(\text{g}) + \text{O}_2(\text{g})$

The initial rate of decomposition is  $4.3 \times 10^{-4}$  mol dm<sup>-3</sup> s<sup>-1</sup> when the initial concentration of NO<sub>2</sub> is 0.57 mol dm<sup>-3</sup>. What is the initial rate of decomposition when the initial concentration of NO<sub>2</sub> is 1.14 mol dm<sup>-3</sup>?

4. The following are some information about a reaction at 298 K:

| Experiment | Initial [A]<br>(mol dm <sup>-3</sup> ) | Initial [B] (mol<br>dm <sup>-3</sup> ) | Initial [C]<br>(mol dm <sup>-3</sup> ) | Initial rate<br>(mol dm <sup>-3</sup> s <sup>-1</sup> ) |
|------------|--|--|--|---|
| 1          | 0.05                                   | 0.02                                   | 0.03                                   | 0.3   |
| 2          | 0.10                                   | 0.02                                   | 0.03                                   | 0.6   |
| 3          | 0.05                                   | 0.06                                   | 0.03                                   | 0.9   |
| 4          | 0.05                                   | 0.06                                   | 0.06                                   | 3.6   |

Write the rate equation for the reaction.

## Suggested Answer

1. Let the rate equation:  $\text{Rate} = k [\text{NO}(\text{g})]^x [\text{H}_2(\text{g})]^y$

For Expt 1:  $0.006 = k (0.01)^x (0.01)^y$  --- (1)

For Expt 2:  $0.144 = k (0.02)^x (0.03)^y$  --- (2)

For Expt 3:  $0.012 = k (0.01)^x (0.02)^y$  --- (3)

(3)/(1):  $0.012 / 0.006 = (0.02 / 0.01)^y$

$\Rightarrow y = 1$

(2)/(1):  $0.144 / 0.006 = (0.02 / 0.01)^x (0.03 / 0.01)$

$\Rightarrow x = 3$

Sub  $x = 3$  and  $y = 1$  into (1)  $\Rightarrow k = 600000$

Rate equation:  $\text{Rate} = 600000 [\text{NO}(\text{g})]^3 [\text{H}_2(\text{g})]$

2. Let the rate equation:  $\text{Rate} = k [\text{CO}(\text{g})]^x [\text{NO}_2(\text{g})]^y$

For Expt 1 and 2:  $[\text{NO}_2(\text{g})]$  was kept constant,

If  $[\text{CO}(\text{g})]$  was doubled, initial rate was also doubled.

$\Rightarrow$  1<sup>st</sup> order w.r.t.  $\text{CO}(\text{g})$

$\Rightarrow$  i.e.  $x = 1$

For Expt 1 and 3  $[\text{CO}(\text{g})]$  was kept constant,

If  $[\text{NO}_2(\text{g})]$  was doubled, initial rate was also doubled.

$\Rightarrow$  1<sup>st</sup> order w.r.t.  $\text{NO}_2(\text{g})$

$\Rightarrow$  i.e.  $y = 1$

Sub  $x = 1$  and  $y = 1$  into (1)  $\Rightarrow k = 1.25$

Rate equation:  $\text{Rate} = 1.25 [\text{CO}(\text{g})] [\text{NO}_2(\text{g})]$

3.  $\text{Rate} = k [\text{NO}_2(\text{g})]^2$

$4.3 \times 10^{-4} = k (0.57)^2$

$k = 1.323 \times 10^{-3}$

$\text{Rate} = 1.323 \times 10^{-3} [\text{NO}_2(\text{g})]^2$

$= 1.323 \times 10^{-3} (1.14)^2$

$= 1.72 \times 10^{-3} \text{ mol dm}^{-3} \text{ s}^{-1}$

4. Let the rate equation:  $\text{Rate} = k [\text{A}]^x [\text{B}]^y [\text{C}]^z$

For Expt 1 and 2: [B] and [C] was kept constant,  
If [A] was doubled, initial rate was also doubled.  
 $\Rightarrow$  1<sup>st</sup> order w.r.t. A  
 $\Rightarrow$  i.e.  $x = 1$

For Expt 1 and 3 [A] and [C] was kept constant,  
If [B] was tripled, initial rate was also tripled.  
 $\Rightarrow$  1<sup>st</sup> order w.r.t. B  
 $\Rightarrow$  i.e.  $y = 1$

For Expt 3 and 4 [A] and [B] was kept constant,  
If [C] was doubled, initial rate was quadrupled.  
 $\Rightarrow$  2<sup>nd</sup> order w.r.t. C  
 $\Rightarrow$  i.e.  $z = 2$

Sub  $x = 1$ ;  $y = 1$  and  $z = 2$  into (1)  $\Rightarrow k = 10^6/3$

Rate equation:  $\text{Rate} = 10^6/3 [\text{A}] [\text{B}] [\text{C}]^2$

**The End**
